

ATG|file

File Sharing & Collaboration

ATG|file, powered by FileLocker™, is designed to solve growing security concerns over the method of file sharing and the control over such file-sharing and collaboration. All business departments must share files. So use ATG|file to improve employee productivity, and provide multiple layers of security to protect enterprise data.

Solve the File Sharing Security Dilemma

ATG|file allows each licensed user to securely sync files from multiple folders on their desktop. All folders and file are secured through our end-to-end encryption sync. **ATG|file** will encrypt the folders and files before sending them to the cloud, while in transit data remains encrypted, and once it is in the cloud, it is encrypted again. All data remains encrypted at 256-bit AES for its life in the cloud.

Administrative Control for IT Managers

ATG|file empowers and enables IT managers to take control of who accesses a document or folder, who can share, and who can preview each file. IT managers can set up initial rules and modify them as corporate needs change.

Easy and Accessible Collaboration

ATG|file makes collaboration work. Collaboration in the secure cloud can be used by an entire organization and is inexpensive to deploy, and can allow thousands of employees to access the same data, securely, with the same collaboration software.
